Task **State** Lifecycle Models

The lifecycle of a Task is modelled through its States. To support multiple scenarios in practice, three pre-defined Task State Lifecycle Models exist:

Solo: 1 activity plus 3 rest states realise task scheme based on just a single activity phase, intended for local use of a solo developer.

Team: 2 activity plus 4 rest states realise a task scheme based on two activity phases Planning and Implementation, intended for distributed use by a small team of developers.

Enterprise: 4 activity plus 10 rest states realise a task scheme based on four activity phases Planning, Implementation, Qualification and Integration, intended for distributed use by an enterprise where engineers and agents act in a gated development pipeline.
